

Flexibility, control, convenience, creativity and inspiration combine to offer a simple and stylish lighting and automation system that enhances the ambience of your building and complements its stunning architecture, at the same time saving all possible energy. Your options are virtually unlimited. Our goal at Tesla Energy is to offer homeowners, engineers, architects and developers the widest selection of the latest in automation technology and energy management solutions from Philips Dynalite – Australia.

Automation technology saves energy by regulating your building's electricity usage and automatically controlling lights and electrical devices according to usage, need and preference. For example, motion sensors automatically switch lights on when motion is detected in a room, thereby saving energy when rooms are unoccupied. Daylight sensors control light and shade in a room by detecting the amount of available sunlight and time clocks turn lights on at sunset and off at sunrise – or at any preset time.

Your intelligent home is at your command to save you energy while enhancing your lifestyle and looking stylish. Take charge of your home with your mobile phone or the beautiful control switch panels and touch screens that complement your interior design – available in glass, stone, ceramic, metal or any finish that you can imagine.

Go green by automating your building!
